This area has a number of notable species growing in it. *Clematis quadribracteolata* is found scrambling through the scrub and a solitary specimen of a bushy pimelea species was also found. Unfortunately there was no flowers or fruit to be seen so a subsequent visit should be made to relocate and search for further plants should be made. *Brachyglottis lagopus* was noted in several spots on the creek banks at the eastern end of the area.

There was quite a varied orchid flora which would probably be enlarged with a spring visit. The survey was thorough where access permitted but it is very difficult to penetrate very far into the thicket of shrubs. Accessing the area from the western end or from the hillslopes behind may greatly enlarge the current list of species.
