Checklist of indigenous vascular plants seen at: Mount Mabel Station, Makara river , E. Haurapa.

Grid Ref: S28 155 780

Altitude 200m.asl

Visited: 19.03.2000, T. Silbery, P. Enright, A. Rebergen

Time on site: 4hrs

LIST # 41

Site description: Hillside and terrace forest on calcareous siltstones and mudstones. The predominant tree is black beech (*Nothofagus solandri* ssp. *solandri*) with scattered podocarps and hardwood trees. The understory is predominantly composed of divaricate species, with *Raukaua anomalus* particularly conspicuous. Stock graze the area and at the time of this visit there was much animal sign evident in the forest. In the part of the site most often grazed the ground cover is reduced to exotic grasses. On the margins of the black beech forest there is a band of divaricate species and manuka up to 6m in height, while in the forest there are occurrences of *Pseudowintera colorata* and *Olearia rani* var. *colorata*, both apparently unusual for this climatic zone. Overall, the extremes of wind are the dominant factor in this forest, resulting in an extremely dense understory on those parts most exposed to the north and west. The site would merit a return when ground orchids are in flower

Carex divulsa was present, but not common.

Significant or unusual plants/associations:

Olearia rani var. *colorata* and *Pseudowintera colorata*, along with perching orchids, usually indicative of high rainfall areas.

The liverwort *Targionia*, often an associate of the Jersey fern *Anogramma leptophylla* was present on part of the riverbank, though the time of the visit was outside the period that this fern is visible.
